

Ordering go-live playbook

How to switch the ordering / checkout system from **test** to **live** (real customer charges). Last refreshed 2026-06-24, verified against the live database (`bjvinrzbdrwebylkmbwy`).

Where things stand right now (verified)

Thing	Current value	Meaning
<code>settings.payment_mode</code>	<code>test</code>	Stripe charges fake money. This is the master live switch.
<code>settings.ordering_enabled</code>	<code>true</code>	Ordering UI is on (Create order, pay page all work).
<code>settings.replies_enabled</code>	<code>true</code>	Help Scout sends are on (pay link, paid confirmation, reminders).
<code>settings.auto_order_reminders_enabled</code>	<code>false</code>	Unpaid-order reminders are in dry-run (not actually sent).
<code>approved_no_order</code> needs-attention rule	<code>false</code> (threshold 2 working days)	The "approved but no order link" flag is off.
<code>settings.xero_stripe_account_code</code>	<code>null</code>	No Stripe clearing account — paid invoices aren't auto-marked PAID in Xero.
US tariff config	£39 / €39 / \$39, Xero item <code>910</code>	Set and ready.
Orders so far	16 total, 5 paid (test), 0 placed	The place-to-production step has not yet been run end-to-end.

The whole flow already works in test mode — embedded Stripe checkout, the itemised Xero invoice, the VAT-invoice email, the Help Scout confirmation, the in-house note / supplier email hand-off, and the new cancel + revision flows. Going live is essentially flipping one setting **once the live credentials are in place**.

How the switch actually works

`payment_mode` is read by `create-checkout-session` at request time, so flipping it needs **no redeploy**:

- `test` → uses `STRIPE_SECRET_KEY_TEST` + `STRIPE_PUBLISHABLE_KEY_TEST`

- `live` → uses `STRIPE_SECRET_KEY_LIVE` + `STRIPE_PUBLISHABLE_KEY_LIVE`

The pay page gets its publishable key + PaymentIntent **from the server**, so there's nothing to rebuild on the frontend either. The Stripe webhook verifies incoming events against whichever signing secret matches (`_LIVE` or `_TEST`), so it accepts live events the moment the live signing secret is set.

Preconditions — do these BEFORE flipping (the risky bits)

These are the steps that, if missed, break a real order. None of them are in the `settings` table — they're credentials/config held elsewhere.

A. Live Stripe credentials set as Edge Function secrets (Supabase dashboard → Edge Functions → Manage secrets, project `bjvinrzbdrwebylkmbwy`):

- `STRIPE_SECRET_KEY_LIVE` = your `sk_live_...` key
- `STRIPE_PUBLISHABLE_KEY_LIVE` = your `pk_live_...` key
- `STRIPE_WEBHOOK_SECRET_LIVE` = the `whsec_...` from the live webhook endpoint (step B)

B. A live Stripe webhook endpoint (Stripe dashboard, in **Live mode**):

- Add an endpoint pointing at the `stripe-webhook` function URL

(`https://bjvinrzbdrwebylkmbwy.supabase.co/functions/v1/stripe-webhook`)

- Subscribe it to `payment_intent.succeeded`
- Copy its signing secret into `STRIPE_WEBHOOK_SECRET_LIVE` (step A)
- (The test-mode webhook is separate and stays as-is.)

C. Xero connected to your REAL org, not the Demo Company. Xero is currently connected (there's a live token), but confirm the connected organisation is the real Plasma org — invoices from real orders land in whatever org is connected. If it's on the Demo Company, reconnect via the Xero auth flow before the first real order.

D. (Recommended, optional) Set a Stripe clearing-account code in Xero and put it in `settings.xero_stripe_account_code`. Without it, a paid order's Xero invoice is raised but stays *unpaid* until your bank feed reconciles, so the customer's "Download VAT invoice" link shows the soft "available shortly" message rather than a paid invoice. With it, paid orders are auto-marked PAID and the link works immediately.

Go-live steps (in order)

1. Final test-mode dry-run (do the bit that's never been run). On an approved proof, in test mode:

- Create an order → pay with a Stripe test card (`4242 4242 4242 4242` , any

future expiry/CVC) → confirm: order flips to **paid**, the Xero invoice is created with the right lines (product code + tooling `020` + shipping `050` intl / `052` UK + tariff `910` where US), the VAT invoice emails, and the Help Scout confirmation posts.

- **Place it** (Review & place) — in-house *and*, if you can, a supplier order — and confirm Stock Control picks it up and the artwork files attach.

- Run a **cancel** on an unpaid order and a **revision** (reopen a paid order) once, so you've seen those flows.

⚠ 0 orders have been *placed* so far — make sure you exercise the place step at least once in test before going live.

2. Put the live credentials in place — preconditions A, B, and confirm C.

3. Flip to live:

- Admin → Settings → set payment mode to **Live**, or run:

```
update proofs.settings set payment_mode = 'live';
```

- No redeploy needed.

4. First REAL order — prove the whole chain with real money:

- Place a small real order yourself (your own card, small quantity).
- Confirm: a real charge appears in Stripe **Live**, the order → **paid**, the

Xero invoice lands in the **real org** with correct line items, the VAT invoice emails, and the HS confirmation posts.

- **Before your first real US order specifically:** check the mixed

VAT-inclusive + zero-rated **910** tariff invoice on the live Xero org — that exact line combination has never been exercised live.

- Place it and confirm the Stock Control / supplier hand-off.
- Then **void/refund** that proving order in Stripe + Xero to keep the books

clean.

5. After a clean week of real orders — turn on unpaid-order reminders:

- `update proofs.settings set auto_order_reminders_enabled = true;`
- Sends up to two gentle reminders on the HS thread for unpaid order links; stops

the moment an order is paid / expires / is cancelled.

6. (Optional) Enable the "approved, no order link sent" flag:

- Admin → Follow-ups (Needs-attention) → enable `approved_no_order` . Flags an approved proof that's had no order link sent for ≥ 2 working days.

Kill switch / rollback

- Flip `payment_mode` back to `test` — instantly stops real charges, no

redeploy. This is the safe abort if anything looks wrong.

- `ordering_enabled = false` — hides ordering entirely if you need to pull it.

The flips, at a glance

Setting	Now	Target	When
<code>payment_mode</code>	<code>test</code>	<code>live</code>	At go-live (after preconditions)
<code>auto_order_reminders_enabled</code>	<code>false</code>	<code>true</code>	After a clean week live
<code>approved_no_order</code> rule enabled	<code>false</code>	<code>true</code>	Optional, any time
<code>xero_stripe_account_code</code>	<code>null</code>	a clearing-account code	Optional, recommended

Things to watch once live

- **"Sent but not recorded"**: if a hand-off posts to Help Scout / the supplier

but the status flip fails, you get a distinct error telling you to mark the order placed manually — do NOT retry (that re-sends). Rare, but know the signal.

- **Supplier email attachments**: the supplier email now attaches the artwork

files (like the in-house note), with the Dropbox link as a backup. The first live supplier send is the real proof that Help Scout emails the attachments out.

- **Cancelling a *paid* order** is deliberately a manual refund (Stripe + Xero) —

there's no in-app button for it, only the revision/hold path. Reopening a paid order holds it for revision; it does **not** auto-refund.

- **VAT invoice link** only goes "ready" once Xero marks the invoice PAID — which

needs either the clearing account (precondition D) or your bank-feed reconciliation. Until then the customer sees the soft "available shortly" copy.
